

WASPS

Wasps are very susceptible to pesticides – if the nest is exposed. They can be difficult if the nest is concealed inside a wall void or beneath shrubs or rockery in the ground.

Do it yourself: If you want to do it yourself there are wasp aerosols available in the garden section of major retail stores. You need to apply directly into the nest opening. It is best done at night when the temperature is below 50F. Wear protective clothing and follow the label directions.

Paratex service: Our professional service is guaranteed to eliminate the existing wasp infestation. In the majority of cases this involves one trip and we will gladly quote a firm price on the telephone. Should there be a need to return for a second trip there is no additional charge. Do not knock the nest down for several days after treatment to be sure all wasps are eliminated. It will naturally deteriorate if no wasps are present. The wasps will not rebuild at that location.
